(57) Abstract

PROBLEM TO BE SOLVED: To provide a thermal recording system, an information operation apparatus and a recording medium containing a program to be executed by a computer capable of providing a high quality image in a low cost structure.

SOLUTION: This thermal recording system comprises a personal computer 1 for outputting print data to be printed and a sublimation type printer 3 for printing the outputted print data by means of a thermal head having heating resistors. The personal computer 2 stores resistance value data of the heating resistors on the thermal head in a hard disk drive and generates correction print data by correcting print data to be printed, based on the stored resistance value data to output it to the sublimation type printer 3. The printer 3 receives the correction print data outputted from the computer 2 and executes the printing by heating the heating resistors on the thermal head based on the
